

# Inline Image Size Check

This document tests whether an inline raster `<img>` embedded directly inside a flowing paragraph (not wrapped in a block-level `<figure>`, as `picture.html` does) is detected as a picture region at all, using a larger (300x180px, same size as the SVG in `picture.html`) image to rule out the `small-image-in-kitchen_sink` result being a size artifact. Here it is

inline: right in the middle of this sentence, followed by more text after the image to confirm the paragraph continues flowing around/after it.
