

List Extraction Test

This document exercises ordered, unordered, and nested list handling — the nested lists are the fixture responsible for proving real multi-depth parent/child graph wiring (a plain list-in-list is a genuine structural nesting, unlike headings which appear to be flat siblings under body).

Unordered, top-level

- First unordered item
- Second unordered item
- Third unordered item, with a nested list:
 - Nested unordered item A
 - Nested unordered item B

Ordered, top-level

1. First ordered step
2. Second ordered step
3. Third ordered step, with a nested list:
 1. Nested ordered sub-step one
 2. Nested ordered sub-step two
